

Simanchal Padhy is a scientist working in seismological observatory at National Geophysical Research Institute (NGRI), India. He received M.Sc (Electronics) from Berhampur University, M.Sc (Applied Geophysics) from the Indian School of Mines, and Ph.D (Seismology) from Osmania University. He was a DAAD Research Fellow at the Leipzig University. Since June 2010, he is a JSPS Postdoctoral Fellow at The University of Tokyo. His research interest mainly focuses on study of seismic wave propagation and scattering on small-scale heterogeneities using seismological data. This includes modeling and inversion of coda envelopes by numerically solving the radiative transfer equation and other scattering theories. His current research includes Finite Difference Modeling of wavefields in complex media to study the waveguide properties of subduction zones. He also worked on crustal anisotropy inferred from shear wave splitting and travel-time seismic tomography to image the source region of the large earthquakes. He serves as a reviewer for Bulletin of Seismological Society of America, Journal of Seismology, Computers & Geosciences, Journal of Asian Earth Sciences, Journal of Earth System Science, among others.
